

# STABILIZER LATERAL BRACE

SAVE TIME, LABOUR AND EXPENSE

## THE STABILIZER™ PERMANENT LATERAL BRACING SYSTEM MAKES TRUSS BRACING EASY.

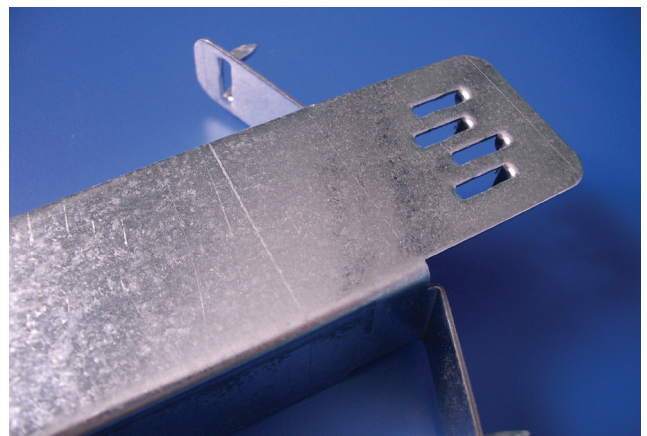

The 24" (or 16") on centre Stabilizer™ system spaces the trusses accurately (to within 1/32") and removes the need for time-consuming, labour-intensive and costly installation and removal of temporary bracing.

### TIME, LABOUR AND LUMBER SAVINGS:

Using the Stabilizer™ system eliminates the need for measuring, cutting, hoisting and handling lumber that would be used for temporary bracing. Furthermore, being a permanent system, using the Stabilizer™ eliminates the need for un-nailing, removing, lowering and disposing of temporary bracing materials. Elimination of these steps translates to time, labour and lumber savings. Moreover, savings are amplified by the fact that less crane time is required given these eliminated activities.

### ONE-STEP INSTALLATION:

Experienced truss erection and stabilizing teams can usually install both the Stabilizer™ bracing and any additional permanent wood bracing fast enough keep pace with the crane hoisting the trusses. While this save more time and cost, it also minimizes the riskiest installation phase of any truss setting job, i.e. the phase after the trusses are set, but before the permanent bracing is installed.
